Collaboration Summary:

I named John Stephen for our collaborative project. Our team, consisting of three members, diligently tackled each task outlined in Assignment 1.

My primary focus was on the 'oddOrPos()' function. I Cautiously addressed each question and crafted my responses. Meanwhile, Trent dedicated his efforts to 'findLast()', and Harinee concentrated on the 'countPositive()' method. Following our individual efforts, we engaged in in-depth discussions and mutually reviewed all our solutions.

In my perspective, we all contributed equally to the first module's assignment. We ensured effective communication through Microsoft team meetings where we discussed our approaches. During the review of Harinee's work, I elucidated the distinction between error states and failure states. It became clear that not every error state translates to a failure state and that outcomes do not singularly define error states.

Should I allocate the total effort percentage, a fair distribution of 100%, each of us contributed equitably by leveraging our unique insights to devise solutions.
